Rules

- Work is done in pairs. Find it yourselves. Pairs can be changed for the 3rd assignment
- Evaluation is based on a 40 min. live interview, and its individual
- Both students can be asked about any aspect of their work, and are expected to answer
  - You can split the work, but be sure to understand everything done so that you can explain it and defend it in the interview

HIGH PERFORMANCE ARTIFICIAL INTELLIGENCE

Barcelona Supercomputing Center
Centro Nacional de Supercomputación

The work

1. Choose a dataset
2. Approve the dataset with the lecturer
    1. No repeated datasets!
3. Train a CNN to solve the problem with the highest possible accuracy
    1. Include all phases, from data preprocessing to results analysis
    2. Consider all the tools mentioned in theory, and use them (or not) wisely

Centro Nacional de Supercomputación

Interview

- During the interview, you will have to explain the experiments conducted.
- Bring support tables and figures, for example:
  - Dataset info: Size, splits, class distributions, dataset samples, technical properties
  - Training results: Loss and accuracy curves
  - Performance reports: Accuracies, confusion matrices
- Which of these are relevant will depend on your experiments! No text.

Centro Nacional de Supercomputación

Evaluation

- You will be evaluated based on your understanding of DL methods
- On the coherency of their use in your work
- On the correct assessment of the results, and on the decisions made as a result

- You have to deliver your trained models through Raco
  - h5 file (trained weights)
  - json file (architecture)
  - txt file (short description of the data used for training/val)

Barcelona Supercomputing Center
Centro Nacional de Supercomputación

Doodle

- To be published in Raco
- Choose a slot for the interview.
- One per pair.
- Specify both names
- Interviews to take place at Omega-207
- Bring a laptop to show the support material
